

1. Executive Summary

Shodh has built a new class of foundation model for the physical world. Its Uniform Physics World Model predicts, optimises, and designs physical systems across scales—from molecular behaviour to industrial mass production.

To our knowledge, Shodh is the first company to demonstrate this kind of joint reasoning across molecular, process and equipment-scale physics within one foundation-model architecture.

This solves the missing intelligence layer in the physical economy. Billions have funded Discovery AI (molecules) and Engineering AI (machines and engineered systems). One of the largest unresolved bottlenecks remains in the middle: the **Industrialisation Gap**.

Translating a digital molecule into a mass-produced reality currently demands years of expensive, manual physical trial and error. Shodh replaces this guesswork with true cross-domain *inverse design*.

At the molecular level, Shodh compressed a 3-month physical formulation test into 24 hours of computation for a premier global CRO. At the equipment level, a prospectively locked recommendation successfully improved chemical factory yield from 82.4% to 96.7%.

Industrialisation provides a high-value commercial entry point. We are commercialising general physical intelligence starting with pharmaceuticals, CDMOs, and specialty chemicals, deployed via two enterprise modules:

Shodh SCALE (Recurring SaaS): Optimises existing processes for a \$250K–\$500K/year base site license plus a capped gain-share on verified factory economics.

Shodh SYNTH (Step-Change Upside):

Computationally invents or redesigns manufacturing routes for massive milestone payouts and selective process-IP royalties.

To accelerate enterprise deployment, Shodh leverages a heavyweight advisory board—including **Kiran Mazumdar-Shaw** (Founder, Biocon), **Rahul Singhvi** (ex-CEO, >\$8B raised), and **Arun Seth** (Enterprise tech veteran)—to secure immediate institutional trust and global market access.

Empirical scaling suggests compute expands this capability predictably. With paid pilots already converting into \$250,000/year SaaS licenses, Shodh is raising **\$55M in equity capital**. This funds the compute required to ride our proven power-law curve, scaling a world-first scientific breakthrough into a global intelligence platform.

Investment Case at a Glance

Proven Today

Frontier AI Breakthrough:

A new class of Uniform Physics World Model successfully built, proving cross-scale reasoning with an empirically measured power-law scaling curve.

Multi-Scale Physical Results:

Prospective factory scale-up (Aarti Industries: +14.3 pts in yield) and zero-day formulation prediction (Syngene: matching 3-month wet-lab data in 24 hours).

Commercial Traction:

Paid validations converting to \$250,000/year recurring enterprise SaaS site licenses.

Enterprise Gravity:

9 active/scoped programmes, backed by an advisory board of globally recognized industrial leaders.

What This Round Establishes

Generalisation:

Repeatability across expanded process classes via dozens of parallel physical validations.

Capability Unlocks:

Scaling H100/B200 compute infrastructure to enable zero-shot transfer across unseen domains.

Software Margins:

Declining human adaptation effort and computational hours per new programme.

Commercial Scale:

Repeatable private SCALE deployments and a scalable organisation with dedicated commercial leadership.
